

Payment Rail v2 — Flow Diagrams

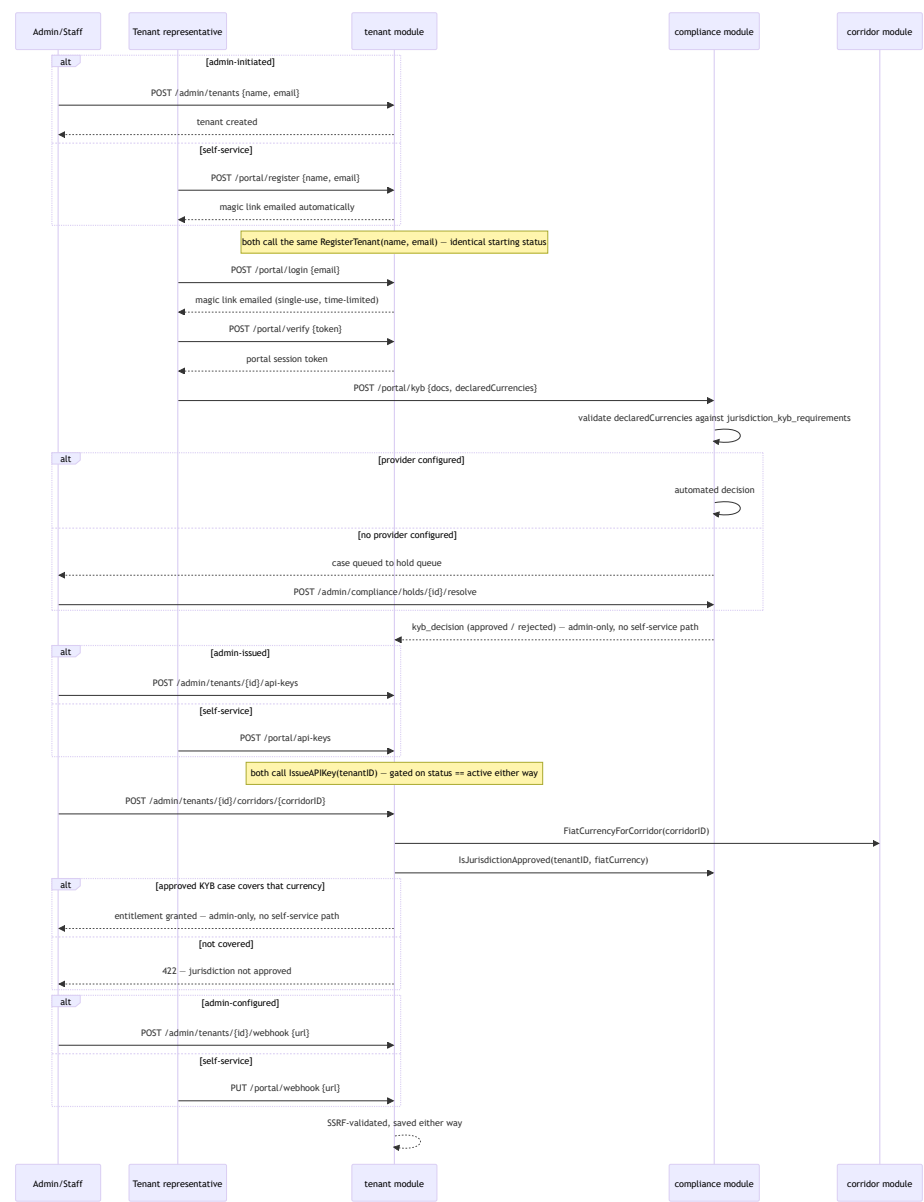

High-level architecture

Clients → the three auth surfaces → module map → ledger → Postgres

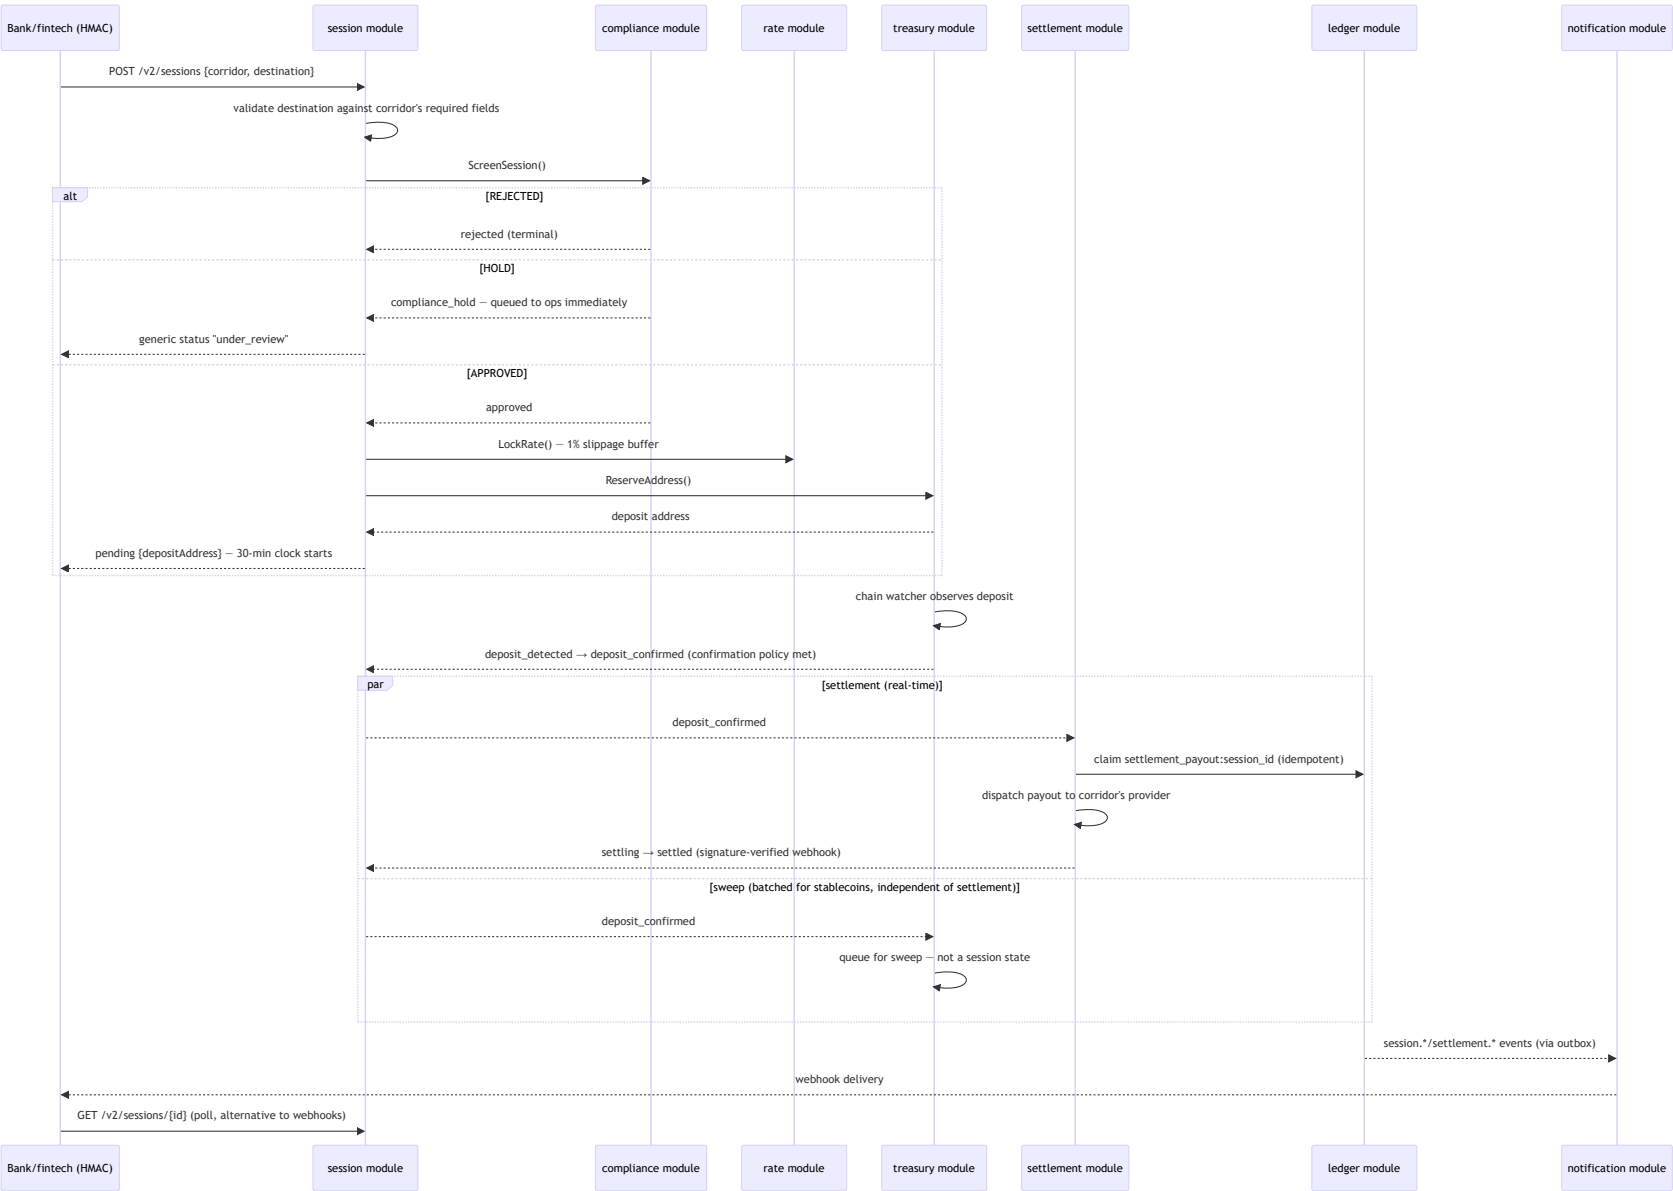

Onboarding flow

Registration, credential issuance, and webhook config are each either admin-driven or tenant self-service; KYB review and corridor entitlement stay admin-only.

Transaction flow

Session creation through the settlement/sweep fan-out to webhook notification

Session state machine

sla_breached_at is orthogonal to this — a timestamp flag, not a state — set at the 30-minute mark for any session past pending that hasn't reached settled
